

CFEH Facebook Case #150

A 52 year old Caucasian female presented for examination of peripheral retinal lesions. She has a history of breast cancer that was treated 12 months previously with surgery and multiple rounds of chemotherapy. Pupils were equal, round and reactive and the anterior segment normal. Posterior widefield images and OCT scans are below. The lesions are seen to be elevated with significant sub-retinal fluid present. The presentation is consistent with a diagnosis of choroidal metastasis. These findings should be communicated promptly to the patient's oncologist.
